

## CEREC Marginal Blend

**Figures 1 & 2.** Supra-gingival margin transformation with CEREC / IPS Empress CAD restoration. The root blend of the first molar was achieved with a long chamfer margin design, 100 IPS Empress CAD block, light cervical staining and bonded with transparent Multilink bonding resin. Buccal enamel defects and stains on second premolar and molar were treated with air abrasion and flowable composite.

**Figures 3.** Preparations on second premolar and molar conserve maximum tooth structure. When bonded with CEREC ceramics, they recapture natural tooth strength.

**Figures 4 & 5.** Final photos taken the same day as procedure. CEREC technology presents the opportunity to treat a quadrant with precise, conservative and aesthetic results in one appointment. Patients absolutely love it!
